Syringa reticulata -- Illinois

2017 Farm Bill PRE Project

PRE Score: 9 -- Accept (low risk of invasiveness)
Confidence: 58 / 100
Questions answered: 19 of 20 -- Valid (80% or more questions answered)

Privacy: Public
Status: Submitted

Evaluation Date: September 3, 2017

This PDF was created on June 15, 2018
Plant Evaluated

*Syringa reticulata*

Evaluation Overview

A PRE™ screener conducted a literature review for this plant (Syringa reticulata) in an effort to understand the invasive history, reproductive strategies, and the impact, if any, on the region's native plants and animals. This research reflects the data available at the time this evaluation was conducted.

General Information

Status: Submitted  
Screener: Emily Russell  
Evaluation Date: September 3, 2017

Plant Information

Plant: Syringa reticulata

Regional Information

Region Name: Illinois

Climate Matching Map

To answer four of the PRE questions for a regional evaluation, a climate map with three climate data layers (Precipitation, UN EcoZones, and Plant Hardiness) is needed. These maps were built using a toolkit created in collaboration with GreenInfo Network, USDA, PlantRight, California-Invasive Plant Council, and The Information Center for the Environment at UC Davis.

Click here to see the generated climate matching map for this region. This climate match database is hosted by GreenInfo Network and publicly accessible.
Evaluation Questions

These questions are based on an original article published at the University of California, Davis, and can be found on the PLOS One website, here: https://doi.org/10.1371/journal.pone.0121053

Invasive History and Climate Matching (Questions 1 - 6)

1. Has the species (or cultivar or variety, if applicable; applies to subsequent "species" questions) become naturalized where it is not native?

   - Answer: Yes, which contributes 1 point to the total PRE score.
   - The screener has a High confidence in this answer based on the available literature.

Answer / Justification:

Naturalized populations of Syringa reticulata have been reported in New York, New Hampshire, Massachusetts, Vermont, and Ontario. One occurrence has been reported in Michigan and Minnesota.

Reference(s):

- The Long Island Invasive Species Management Area (2016). LIISMA horticulture watch list.

2. Is the species (or cultivar or variety) noted as being naturalized in the US or world in a similar climate?

   - Answer: Yes, which contributes 2 points to the total PRE score.
   - The screener has a High confidence in this answer based on the available literature.
Answer / Justification:

Areas of New York, Vermont, Ontario, Michigan, and Minnesota are a climate match for Illinois.

Reference(s):

- The Long Island Invasive Species Management Area (2016). LIISMA horticulture watch list.

---

3. Is the species (or cultivar or variety) noted as being invasive in the U.S. or world?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Low confidence in this answer based on the available literature.

Answer / Justification:

Naturalized populations of Syringa reticulata in the United States appear to be relatively recent discoveries. Significant damage has not been documented. S. reticulata appears on invasive lists as a species to watch.

Reference(s):

- The Long Island Invasive Species Management Area (2016). LIISMA horticulture watch list.

---

4. Is the species (or cultivar or variety) noted as being invasive in the US or world in a similar climate?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Low confidence in this answer based on the available literature.
Answer / Justification:

Naturalized populations of Syringa reticulata in the United States appear to be relatively recent discoveries. Significant damage has not been documented. S. reticulata appears on invasive lists as a species to watch, including Illinois.

Reference(s):

- The Long Island Invasive Species Management Area (2016). LIISMA horticulture watch list.

5. Are other species of the same genus (or closely related genera) invasive in a similar climate?

   Answer: Yes, which contributes 1 points to the total PRE score.
   The screener has a High confidence in this answer based on the available literature.

Answer / Justification:

"Recent molecular studies have revealed that Ligustrum and Syringa are closely related and exist in the subtribe Ligustrinae within the tribe Oleae (Wallander and Albert, 2000)." Ligustrum is a serious invasive threat in Illinois.

Reference(s):

6. Is the species (or cultivar or variety) found predominately in a climate matching the region of concern?

   Answer: Yes, which contributes 2 points to the total PRE score.
   The screener has a Medium confidence in this answer based on the available literature.
Answer / Justification:

Parts of the native distribution in Korea, Japan, and China, and introduced occurrences shown in GBIF in Europe and the Midwestern and Eastern United States are a climate match for Illinois.

Reference(s):

Impact on Native Plants and Animals (Questions 7 - 10)

7. Does this plant displace native plants and dominate (overtop or smother) the plant community in areas where it has established?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Low confidence in this answer based on the available literature.

Answer / Justification:

There are no reports of dominating the plant community where established.

Reference(s):

- [Anonymous].

8. Is the plant noted as promoting fire and/or changing fire regimes?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Low confidence in this answer based on the available literature.

Answer / Justification:

There are no reports of changing fire regimes.
9. Is the plant a health risk to humans or animals/fish? Has the species been noted as impacting grazing systems?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Low confidence in this answer based on the available literature.

Answer / Justification:

There are no reports of health risks to humans, animals, or grazing systems.

Reference(s):

- [Anonymous] .

10. Does the plant produce impenetrable thickets, blocking or slowing movement of animals, livestock, or humans?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Low confidence in this answer based on the available literature.

Answer / Justification:

There are no reports of impenetrable thickets in the literature.

Reference(s):

- [Anonymous] .
Reproductive Strategies (Questions 11 - 17)

11. Does this species (or cultivar or variety) reproduce and spread vegetatively?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Low confidence in this answer based on the available literature.

Answer / Justification:

No evidence of vegetative reproduction was found in the literature. Some gardeners report rootstock suckers on grafted Syringa cultivars.

Reference(s):

- [Anonymous] .

12. If naturally detached fragments from this plant are capable of producing new plants, is this a common method of reproduction for the plant?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Medium confidence in this answer based on the available literature.

Reference(s):

- [Anonymous] .

13. Does the species (or cultivar or variety) commonly produce viable seed?

- Answer: Yes, which contributes 1 points to the total PRE score.
- The screener has a Very High confidence in this answer based on the available literature.
Answer / Justification:

Seed is the primary means of reproduction for Syringa reticulata.

Reference(s):

14. Does this plant produce copious viable seeds each year (> 1000)?

Answer / Justification:

No estimates of seed quantity could be found in the literature.

Reference(s):

- [Anonymous] .

15. Is there significant germination (>25%) of seeds the next growing season, with no requirement of an infrequent environmental condition for seeds to germinate (i.e. fire) or long dormancy period?

- Answer: Yes, which contributes 1 points to the total PRE score.
- The screener has a High confidence in this answer based on the available literature.

Answer / Justification:

A 30 to 90 day stratification period is recommended and achieves high germination rates. According to the study below, fall planting of "green" seed can also produce germination > 25%.
Reference(s):

16. Does this plant produce viable seed within the first three years (for an herbaceous species) to five years (for a woody species) after germination?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Medium confidence in this answer based on the available literature.

Answer / Justification:

There is no evidence of a short juvenile period.

Reference(s):

- [Anonymous].

17. Does this plant continuously produce seed for >3 months each year or does seed production occur more than once a year?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Very High confidence in this answer based on the available literature.

Answer / Justification:

Syringa reticulata flowers for about 2 weeks in early summer.

Reference(s):

Dispersal (Questions 18 - 20)

18. Are the plant’s propagules frequently dispersed long distance (>100 m) by mammals or birds or via domestic animals?

   • Answer: No, which contributes 0 points to the total PRE score.
   • The screener has a Medium confidence in this answer based on the available literature.

Answer / Justification:

There is no evidence of dispersal by animals.

Reference(s):

   • [Anonymous] .

19. Are the plant’s propagules frequently dispersed long distance (>100 m) by wind or water?

   • Answer: Yes, which contributes 1 points to the total PRE score.
   • The screener has a Low confidence in this answer based on the available literature.

Answer / Justification:

The seeds are dispersed when capsules dry and split open. They are winged so wind may aid in dispersal, but long-distance dispersal by wind seems unlikely. However, in Vermont: "Less than 170 m away, along the roadside and spreading into a clearing, were large, flowering individuals, surrounded by numerous, smaller, immature individuals." Naturalized populations in New York state are in riparian areas, so long distance dispersal by water may be a factor.
Reference(s):

20. Are the plant’s propagules frequently dispersed via contaminated seed (agriculture or wildflower packets), equipment, vehicles, boats or clothing/shoes?

- Answer: No, which contributes 0 points to the total PRE score.
- The screener has a Medium confidence in this answer based on the available literature.

Answer / Justification:

There are no reports of accidental dispersal by people.

Reference(s):

- [Anonymous] .

Total PRE Score

PRE Score: 9 -- Accept (low risk of invasiveness)
Confidence: 58 / 100
Questions answered: 19 of 20 -- Valid (80% or more questions answered)

PRE Score Legend

The PRE Score is calculated by adding the point totals for each (answered) question.
< 13 : accept (low risk of invasiveness)
13 - 15 : evaluate further
> 15 : reject (high risk of invasiveness)
Questions Answered Legend

It is important to answer at least 16 questions to consider a PRE Score as "valid".

>= 16 : valid (80% or more questions answered)
<= 15 : invalid (not enough questions answered)

Evaluation Reviewers

The PRE approach is to base decisions on science and make decisions by consensus of diverse horticultural stakeholders. The literature review and process of answering PRE’s questions are based on science; the decisions of which plants to prioritize are based on consensus. To ensure this process is in place and that PRE is collaborative, volunteer stakeholders are recruited from each region to review evaluations. The following experts in their profession (plant science, conservation, or horticultural trade) have participated as volunteer PRE reviewers for this evaluation:

• Steve Worth December 22, 2017
• Kim Shearer November 18, 2017

This evaluation has a total of 2 reviewer(s).
Evaluation Issues

The following section lists all public issues for this evaluation. Issues provide a way for stakeholder reviewers to communicate any concerns or suggestions they might have with the plant or evaluation. Please email PlantRight@suscon.org if additional action is required to resolve open issues.

Issue ID # 6221

Date Created: December 22, 2017 - 11:46am  Date Updated: February 19, 2018 - 7:46pm

Submitted by: Steve Worth

Status: Fixed  Type: Comment  Severity: Minor  Scope: Q03. Is the species (or cultivar or variety) noted as being invasive in the U.S. or world?

Issue Description

The reviewer claims that the plant has only been widely planted in recent years. I would disagree with that statement. We have been growing and shipping that plant throughout the upper midwest region for more than 20 years and this is the first time that I have heard of any concerns as to its invasiveness.

Issue Resolution (Screener's Response to Issue)

Changed the wording of that answer to: "Naturalized populations of Syringa reticulata in the United States appear to be relatively recent discoveries."
About PRE and this Plant Evaluation Report

The PlantRight Plant Risk Evaluator -- PRE is an online database and platform enabling those involved in non-native, terrestrial plant production to know before they grow if a plant poses a regional invasive risk. This tool offers many benefits, and we encourage you to visit the PRE website (https://pre.ice.ucdavis.edu) for more information.

If you are a nursery trade association, or involved in the research, development or distribution of horticultural plants we invite you to join the PRE community. If you are a plant scientist, affiliated with a horticultural college or botanic garden, and would like to learn more about becoming a PRE Screener, please drop us an email, PlantRight@suscon.org, requesting a PRE Account.

PRE beta funding is provided by Sustainable Conservation (http://www.suscon.org/) and a USDA Farm Bill grant.
